Using *Suggest Subject Terms* to find the best search terms

Some databases, including CINAHL and MedLine, have a search option called *Suggest Subject Terms*.

**How do I use the *Suggest Subject Terms* feature?**

The *Suggest Subject Terms* feature assists users in obtaining more relevant results by utilizing EBSCO’s controlled vocabulary (pre-defined terms, similar to tags) and returning articles that have those subject terms assigned to them.
A search phrase is inserted and executed. (MH means MeSH or Medical Subject Heading.)

This search phrase uses the suggested subject terms for the keyword "handoff." This provides more focused searching.

Next step: Add more keywords and set limitations, for example limit results to "scholarly" and published between 2012 and 2017.
